Model choice

Water resource management technology

Best practice modelling

CSIRO: Who we are

People 6000

Locations 58

Flagships 9

Budget \$1B+

Top 1% of global research institutions in 14 of 22 research fields

Top 0.1% in 4 research fields

We provide scientific responses and solutions to major national and global challenges

CSIRO: What it brings to Water Resource Management

- Significant **depth and breadth** of skills/expertise
- An understanding of complex **multi-disciplinary systems**
- Framework for **integrating science**
- A focus on **impact** in the science that we do

CSIRO supporting water resource management in South Asia

- Brahmani – Baitarni: development of a planning model to support water resource management across three states.
- Koshi Basin: development of a water balance model to support hydro-power, flood and sediment management.
- Indus Basin: development of a planning model to support management of transboundary flows and within country water resource sharing.
- Bangladesh: supporting development of groundwater resource plans

Integrated Water Resource Management

“Integrated Water Resources Management (IWRM) is a process which promotes the coordinated development and management of water, land and related resources, in order to maximise the resultant economic and social welfare in an equitable manner without compromising the sustainability of vital ecosystems.” GWP-TAC, 2000^[1]

Water-Assets-Services-Wellbeing

Sharing a finite and changing resource for people

- **Water System**

- **Water balance** (domestic, irrigation, storage, end-of-system flows) $\sim \Sigma 1$
- **Dynamics** (hydropower flows, low flows, medium flows, flood flows)
- **Additional** (groundwater, desalinisation)

- **Assets**

- **Infrastructure** (water supply, irrigation, hydropower, dams)
- **Natural assets** (estuary, wetlands, floodplains)

- **Services**

- **Products from infrastructure** (food, energy, mitigation)
- **Ecosystem system services** (food, nutrient cycling, recreation)

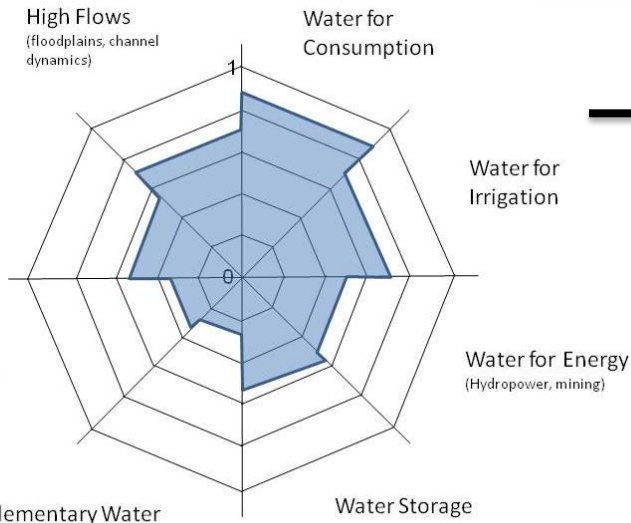

- **Wellbeing**

- **Economic** (water/food/energy security, economic security)
- **Social** (social security, social cohesion, health)
- **Environmental** (environmental security/sustainability)

Conceptual Model Design

- Climate
- Rainfall/Snow/Ice
- Surface/groundwater
- Water quality
- River systems modelling
- Biophysical modelling
 - Ecosystems
- Socio-economic modelling
 - Potable water
 - Hydropower
 - Agriculture
 - Ecosystem services
 - Social benefits

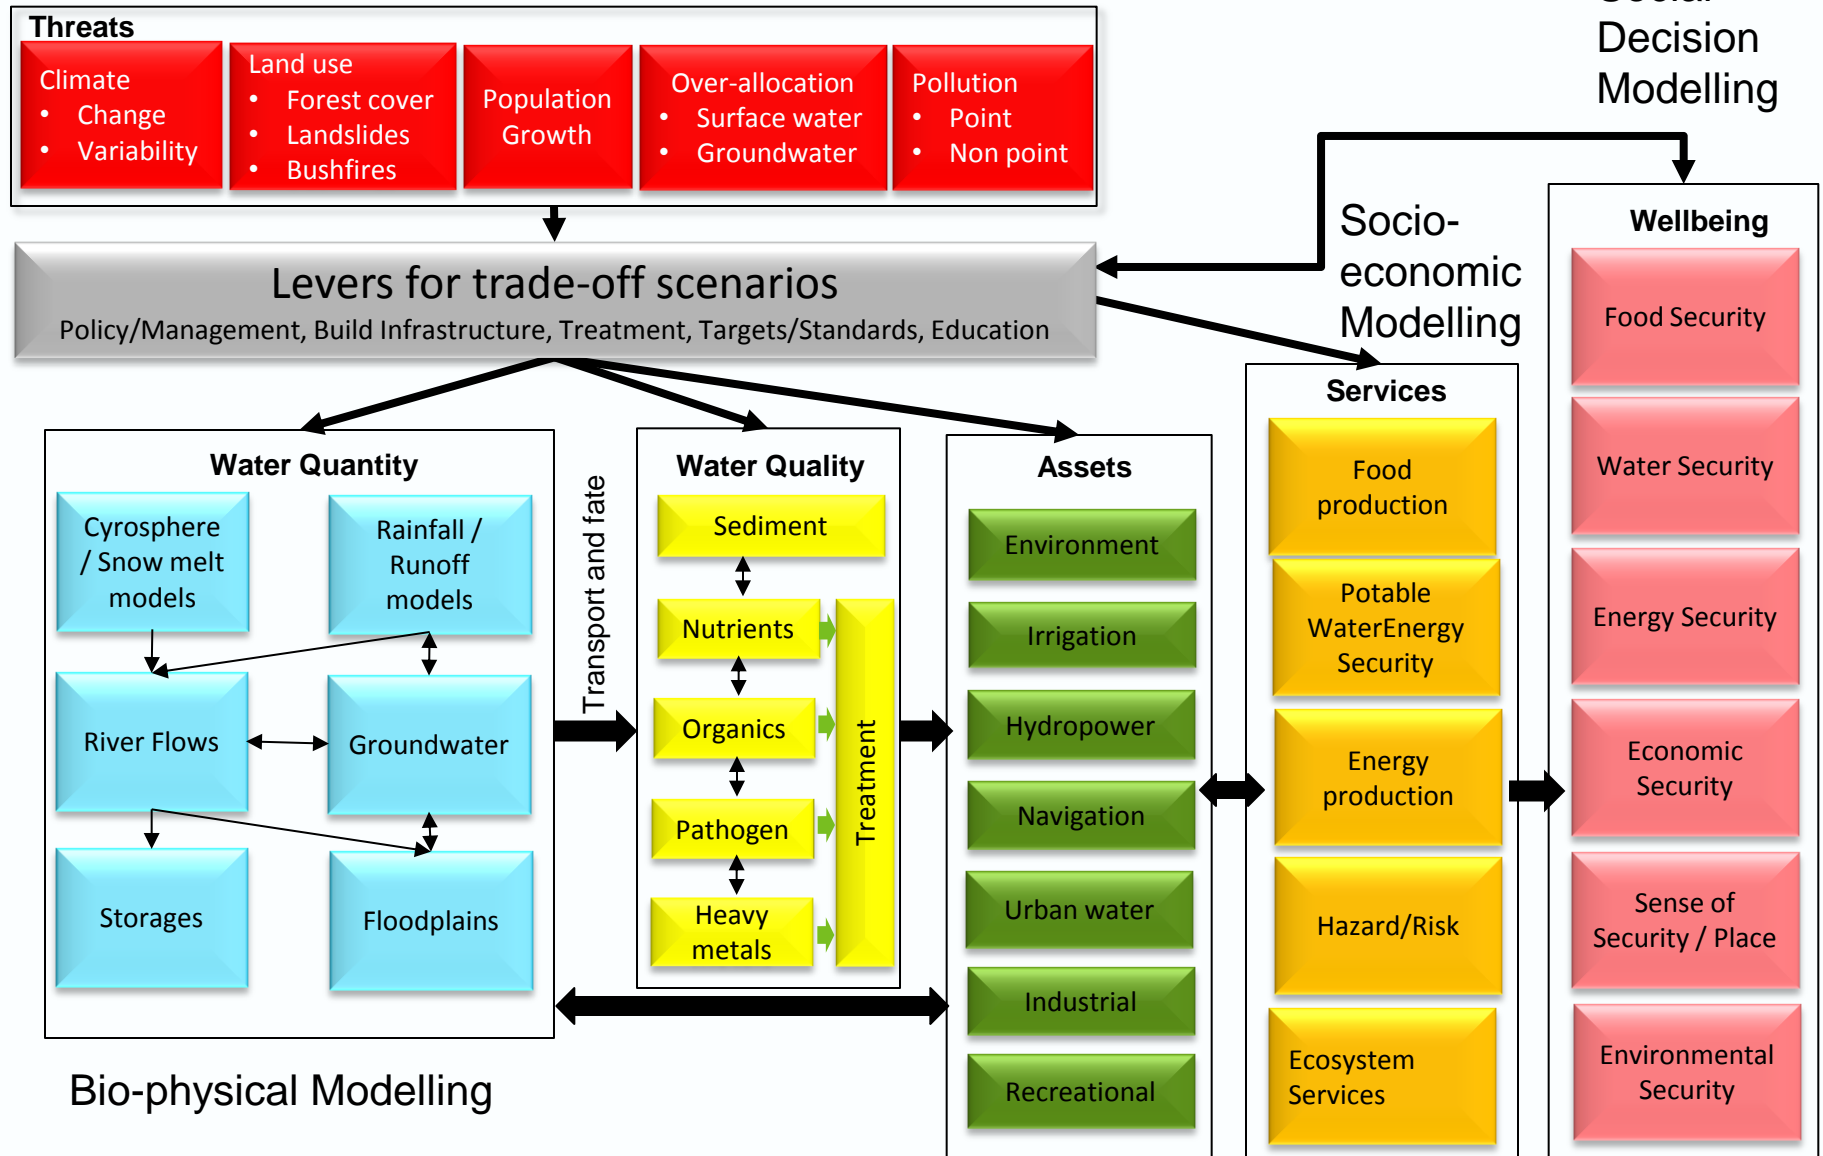

Integrating Conceptual Framework

Risk management

Integrating Conceptual Framework

Risk management

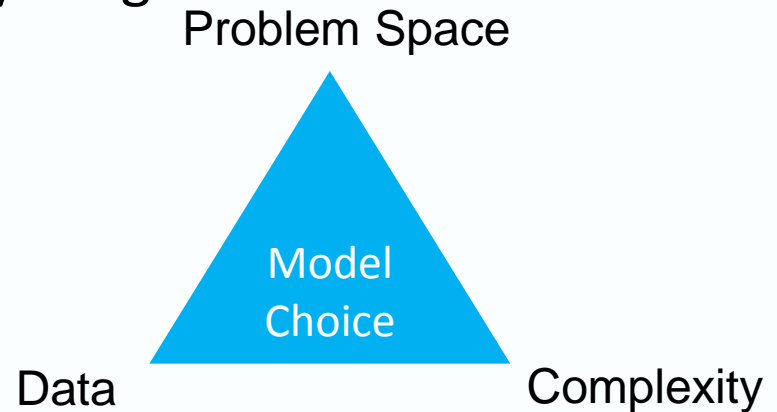

Model choice

There are lots of different models available (too many acronyms to remember) and in many cases the underlying algorithms are similar

There is no one model that can do everything

Model choice is a trade-off

Parsimony: Choose the simplest model that best answers the question

Take into consideration uncertainty. Is the model telling us something useful or is it noise?

Model choice Questions

Problem Space (What are the issues to be considered?)

Planning (scale, sectors, sharing rules, WQ)

Operations (dams, structures, hydro, irrigation, environment, culture, WQ)

Forecasts (scale, lead time, extent, floods, allocations)

Data (What is needed and available?)

Global/Local, Observed/Inferred, Historic/Realtime

What is the uncertainty in the data?

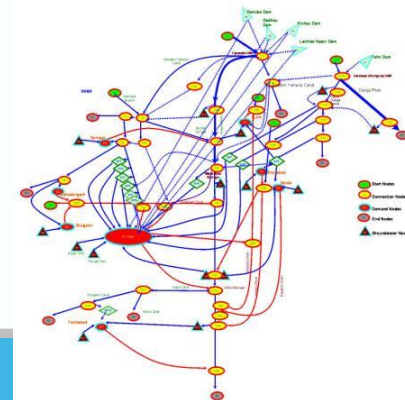

Complexity (What is justified given data and problem space?)

Spatial and temporal scale

Process description

Run times

Number or parameters

Water Resource Management Technology

Remote sensing (LIDAR, DEM, ET and Land use)

Climate surfaces, GCMs and downscaling

Water Resource Information Systems

Flood forecasting systems

Flexible hydrological modelling frameworks

Workflow tools (integrating hydrological, environmental and economic models)

Modelling uncertainty and risk

Technology in the cloud and web

Climate data for South Asia

Climate variables

- Precipitation (rainfall, snow)
- Temperature
- Potential evaporation
- Humidity
- Solar radiation
- Wind speed/run

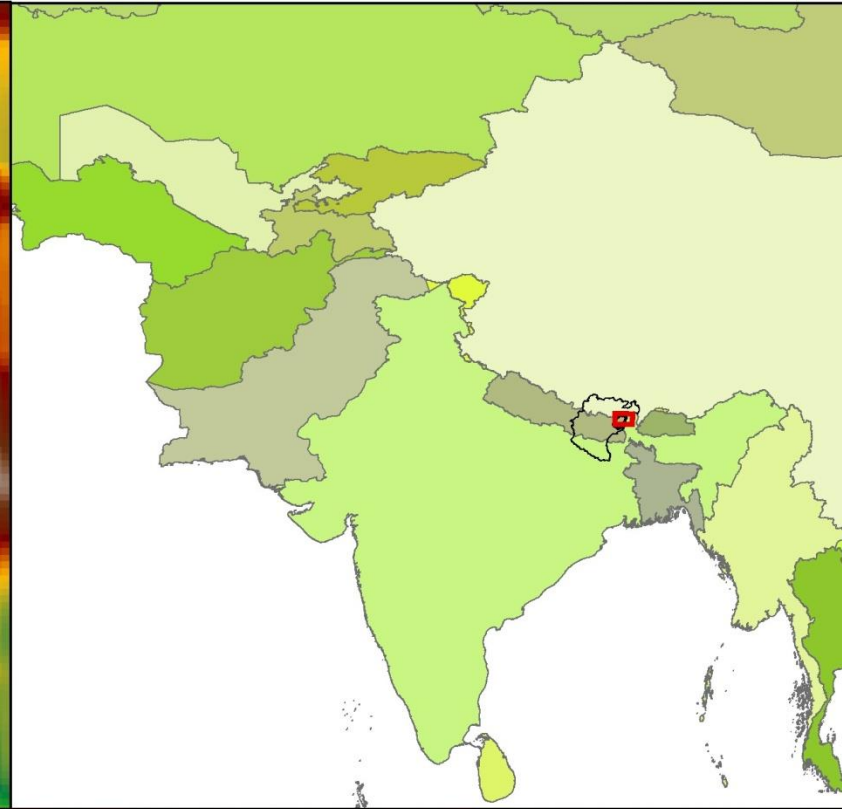

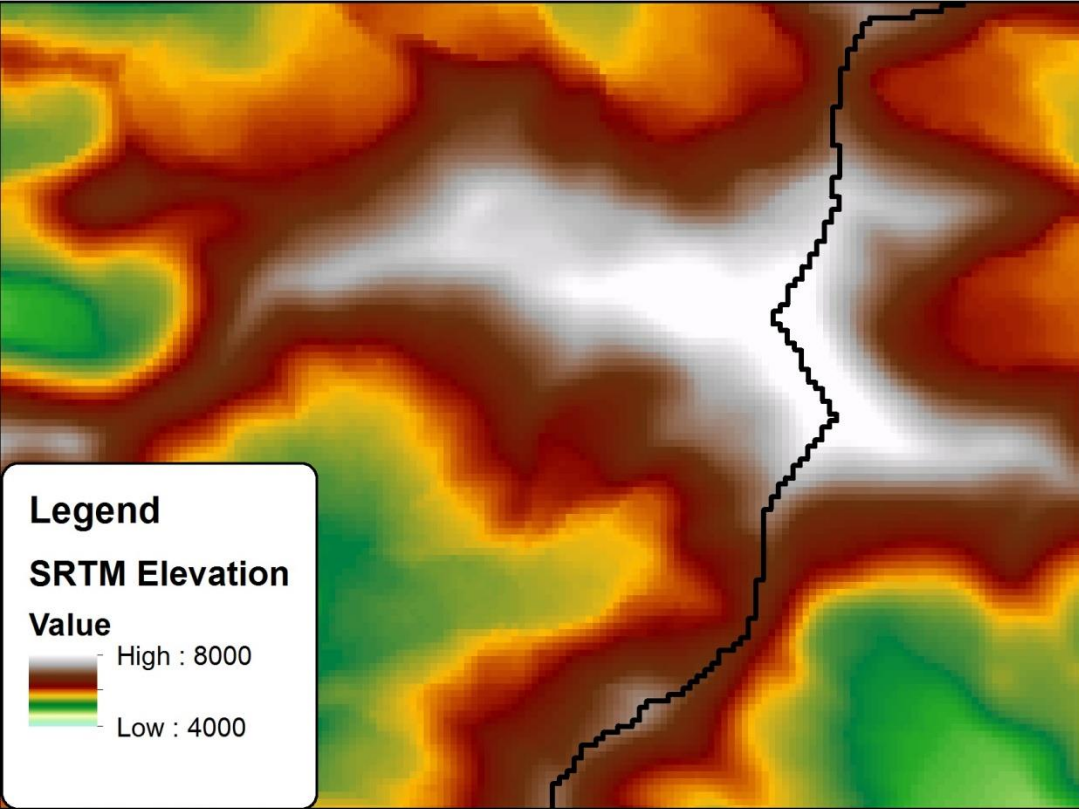

Data sources

- Local climate stations and local data products
- Aphrodite Asian precipitation data base
 - 0.25° gridded daily rainfall data for Monsoon Asia
 - 1951–2007
 - <http://www.chikyu.ac.jp/precip/products/index.html>
- IMD Indian precipitation data base
 - 0.25° gridded daily rainfall data for India
 - 1901–2010
 - <http://www.imd.gov.in/doc/nccraindata.pdf>
- Princeton global reanalyses climate data base
 - 0.5° gridded daily climate data
 - 1948–2008
 - <http://hydrology.princeton.edu/data.pgf.php>

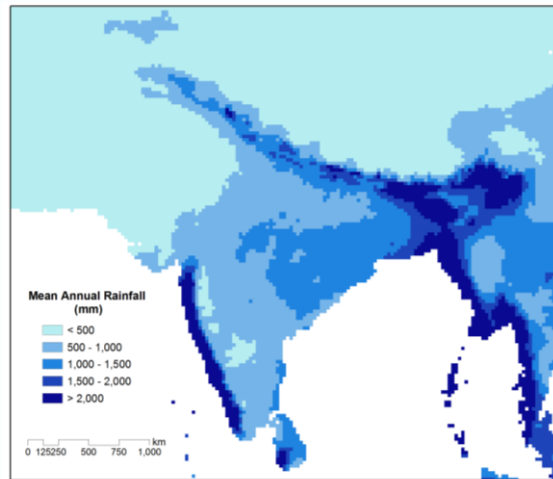

Comparison of annual precipitation series

Precipitation, APET and runoff across South Asia

Mean annual PRECIPITATION

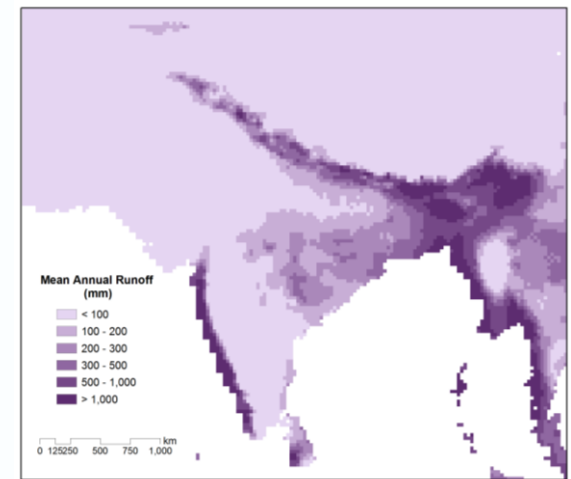

From Aphrodite database

Mean annual AREAL POTENTIAL EVAPORATRANSPIRATION

Estimated from Princeton
climate data using
Morton's E_w formulation

Mean annual RUNOFF

Estimated using
Budyko relationship

IPCC AR5 future temperature projections for South Asia

2046–2065 Dec–Feb temperature relative to 1986–2005 [RCP4.5]

2046–2065 Jun–Aug temperature relative to 1986–2005 [RCP4.5]

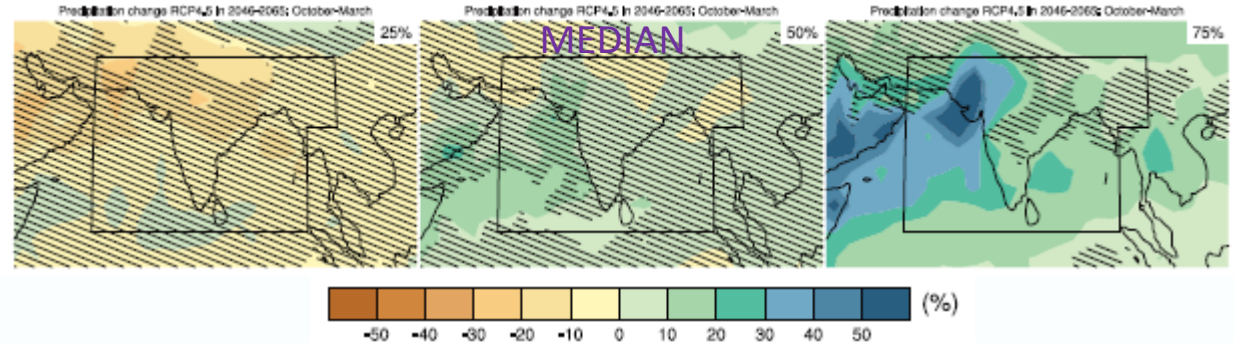

From IPCC AR5 “Atlas of global and regional climate projections”,
<http://www.climatechange2013.org/report/full-report/>

CMIP5 data portal, http://cmip-pcmdi.llnl.gov/cmip5/data_portal.html

IPCC AR5 future precipitation projections for South Asia

2046–2065 Oct–Mar precipitation relative to 186–2005 [RCP4.5]

2046–2065 Apr–Sep precipitation relative to 186–2005 [RCP4.5]

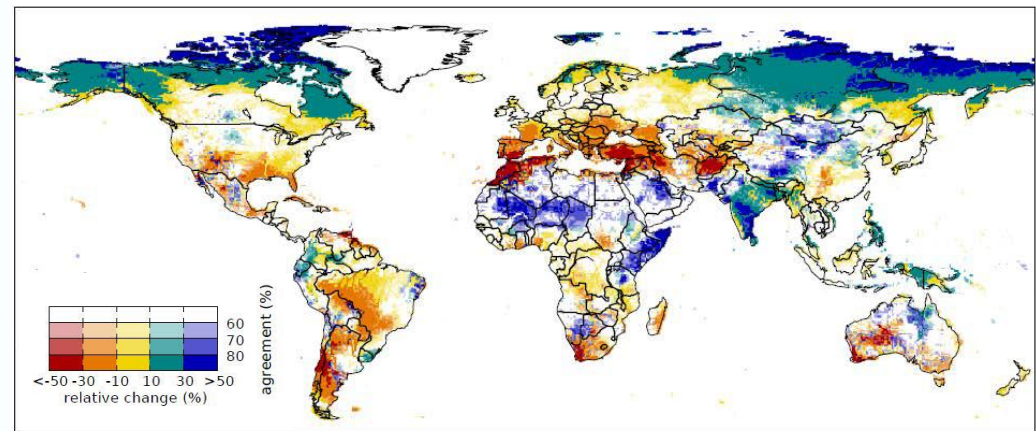

From IPCC AR5 “Atlas of global and regional climate projections”,
<http://www.climatechange2013.org/report/full-report/>

CMIP5 data portal, http://cmip-pcmdi.llnl.gov/cmip5/data_portal.html

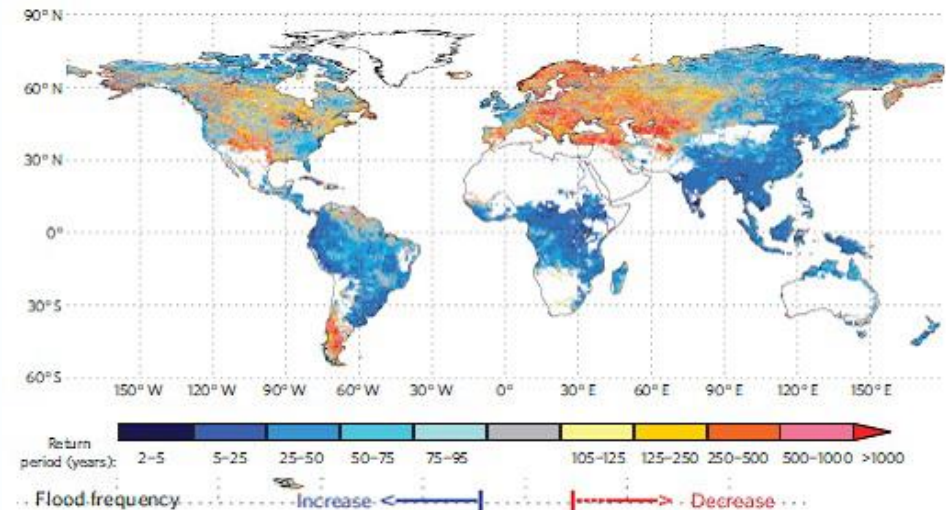

Climate change impact on water

- Changed water availability
- Enhanced variability and reduced water security:
 - longer droughts
 - more precipitation falling as rain rather than snow
 - retreat of glaciers
 - increased seasonality of flow
- Enhanced flood risk

Change in mean annual runoff for 2°C warming

2080 flood frequency for 20th century 100-year flood

Water Resource Information Systems: Geofabric

Australian Hydrological Geospatial Fabric (Geofabric)

The Australian Hydrological Geospatial Fabric (Geofabric) is a specialised Geographic Information System (GIS). It registers the spatial relationships between important hydrological features such as rivers, water bodies, aquifers and monitoring points.

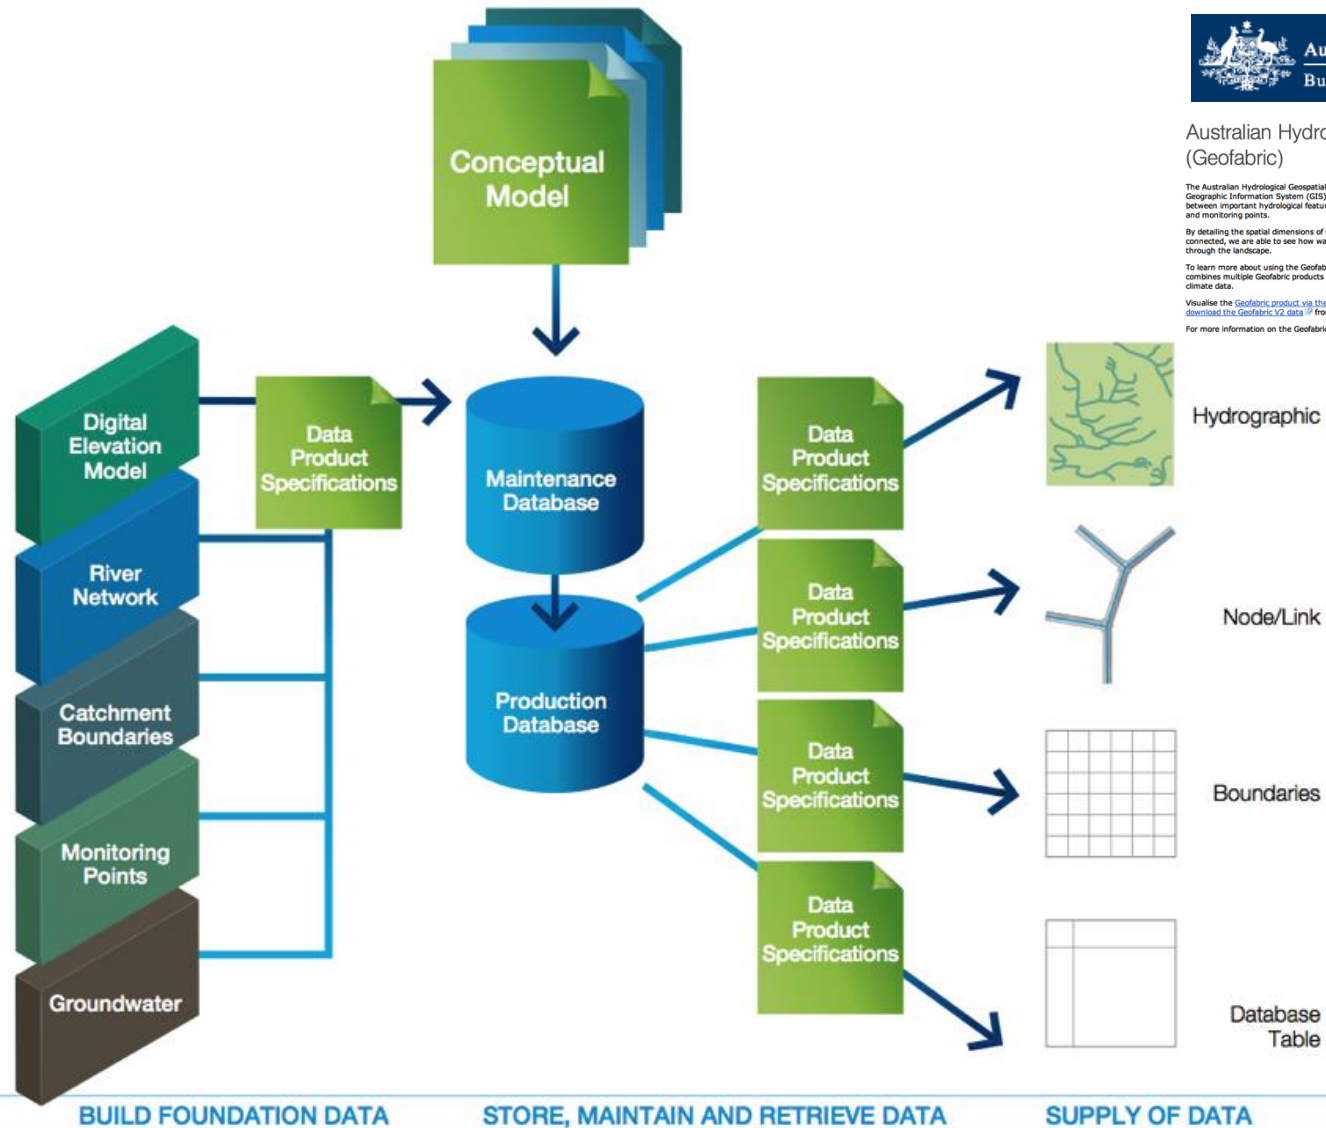

By detailing the spatial dimensions of these hydrofeatures and how they are connected, we are able to see how water is stored, transported and used through the landscape.

To learn more about using the Geofabric, [watch our webinar](#). This webinar combines multiple Geofabric products and then uses the Geofabric to analyse climate data.

Visualise the Geofabric product via the [MapConnect portal](#). For data only, [download the Geofabric V2 data](#) from the Geofabric FTP site.

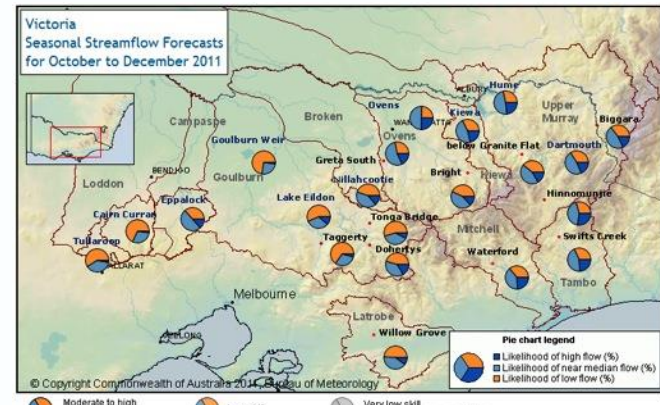

For more information on the Geofabric please contact ahsf@bom.gov.au

 - Glossary
 - Partnerships
 - User feedback

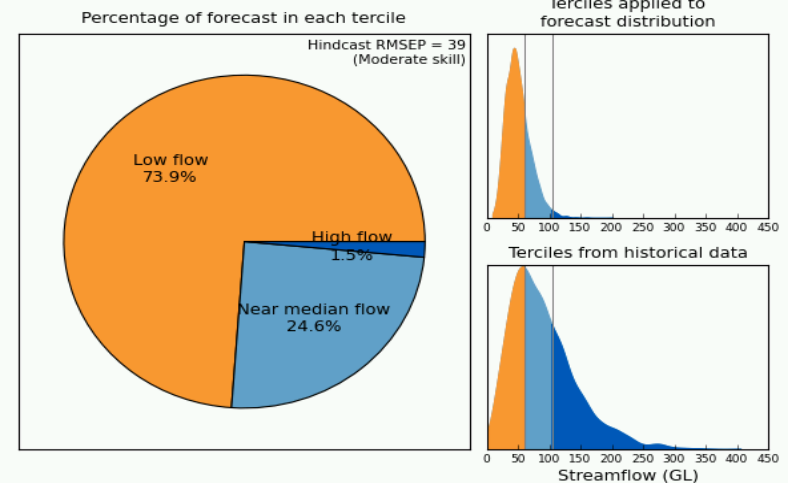

Seasonal streamflow forecasting

- 3 month probabilistic outlook of unregulated total streamflow volumes
- Ensemble forecasts at 74 sites in 32 river basins
- Uses CSIRO developed statistical model (BJP)
- Further testing on sites in all states and territories
- Extend to 200 sites by the mid 2015
- www.bom.gov.au/water/ssf

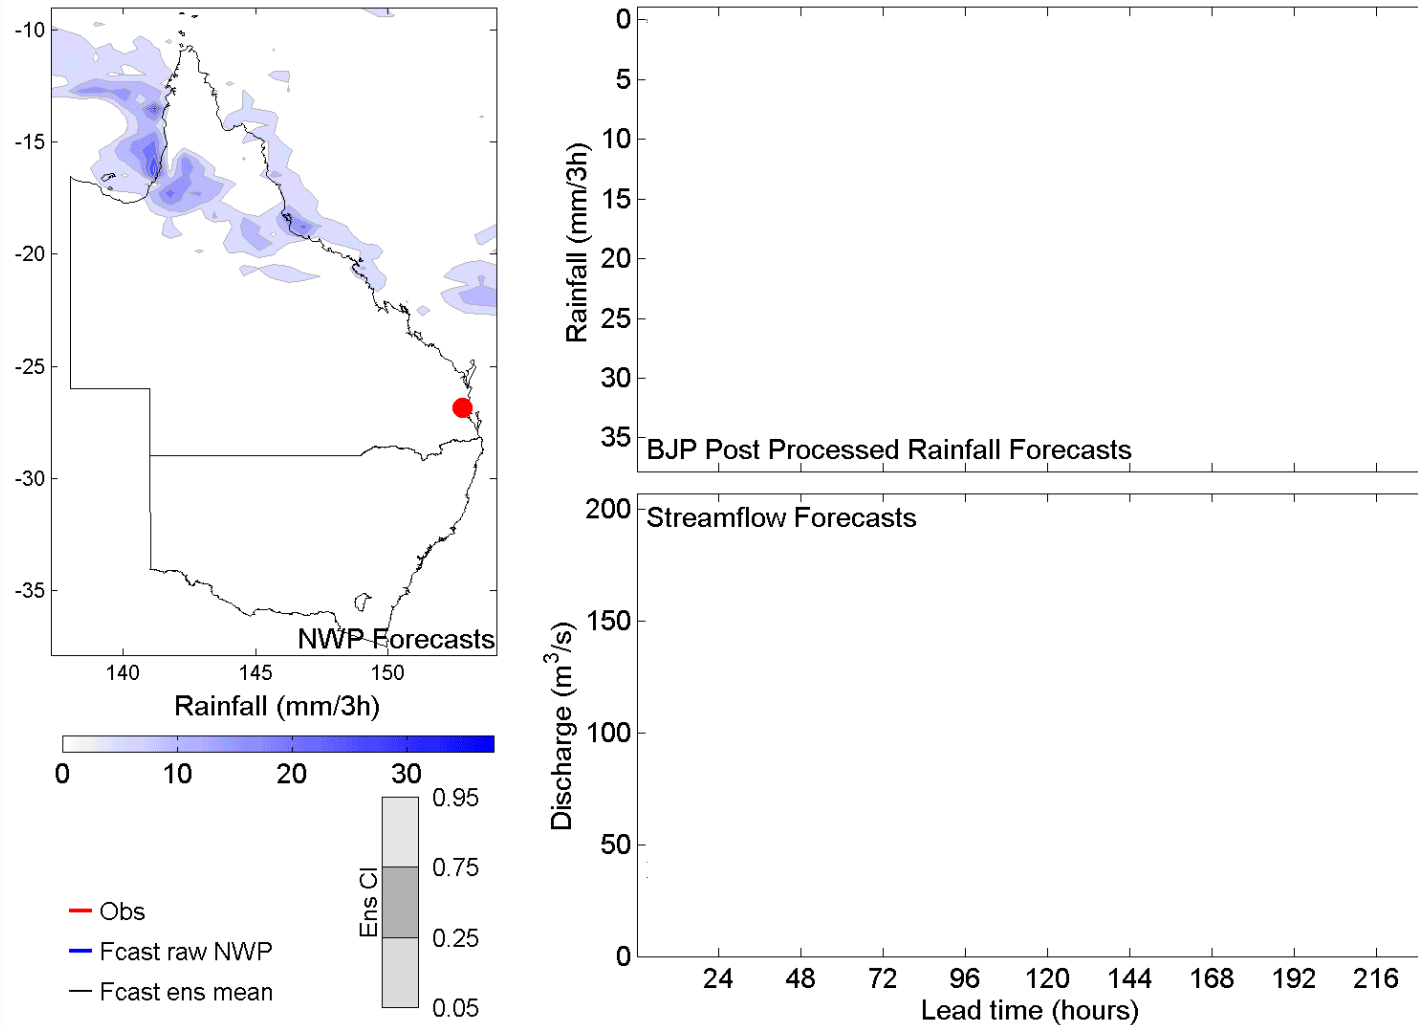

Acheron River at Taggerty (405209)
Forecast period: Oct 2011 - Dec 2011

Flood & short-term forecasting

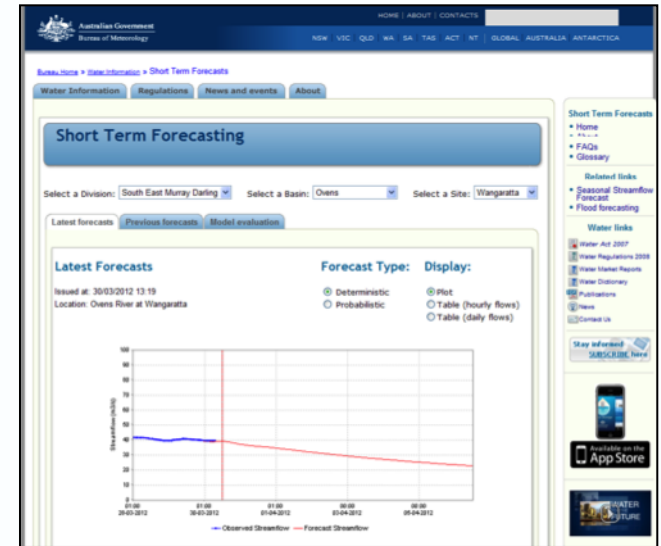

Forecasts issued on 18-Mar-2012 21:00 for 19-Mar-2012 00:00 (UTC)

Ensemble forecast of a flood event in the Stanley River

Short term streamflow forecasting

- Flow forecasts up to 10 days ahead
- Unregulated inflows to regulated systems
- Includes rainfall forecasts
- R&D conducted through CSIRO
- Ovens River pilot for registered users

Flexible hydrological modelling frameworks

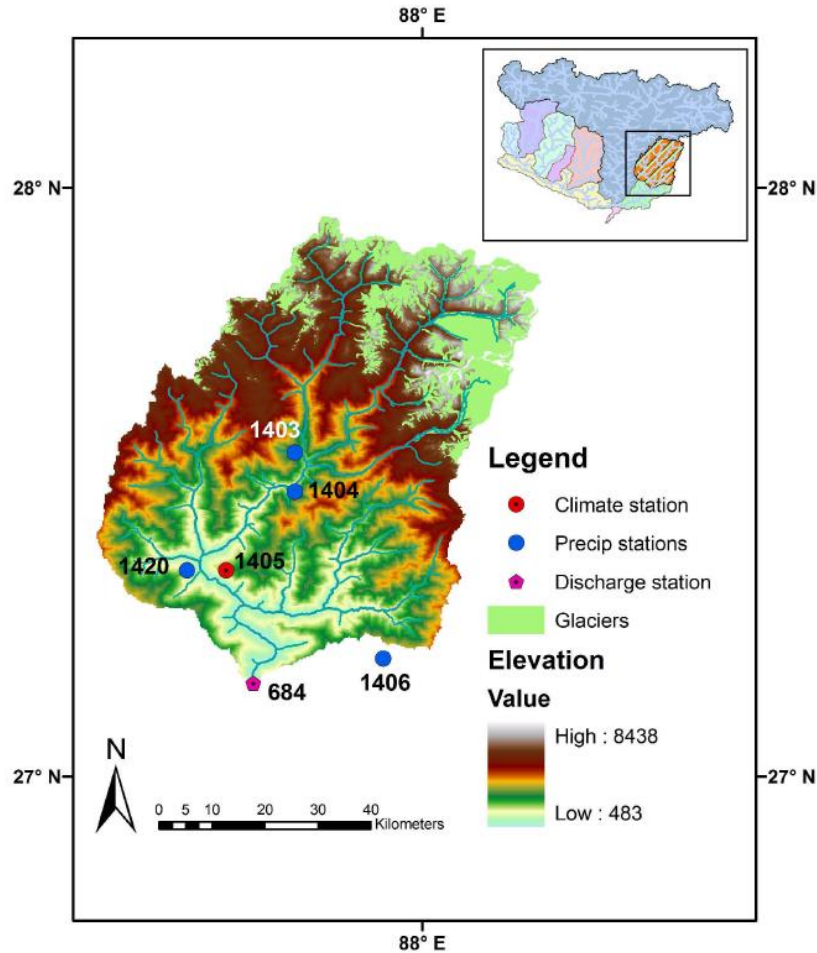

- KEY**
- S- supply
 - r- return flow
 - C- recycled flow
 - D demand

CITIES

Tamor daily rainfall runoff model

- Area: 4058 km²
- Elevation: 422 – 8505 m
- Glacier area: 13%

Rainfall runoff model

- GR4J+snow+glacier
- 7 parameters
- 44 HRUs
- Bias 2% NSE 0.87

Brahmani-Baitarani river model

- Storage
 - Operating Targets
 - Dimensions
 - Constituents
 - Inlet Channel Mixing
 - TSS
 - Additional Inflow Load
 - Gauged Concentrations
 - Groundwater
 - Gauged Level
 - Gauged Releases
 - Outlets

- Geheyan Dam in China
- Different dam break scenarios

Scenario 1

Scenario 2

Scenario 3

Scenario 4

Scenario 5

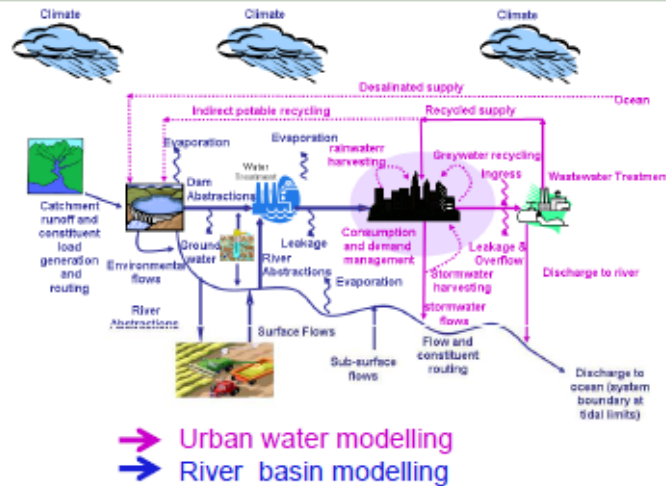

Scenario 6

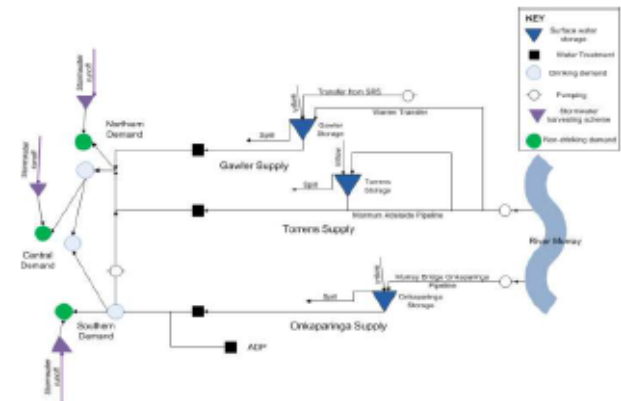

Urban water management

Simulation of urban water systems from supply catchments to receiving waters, as a sub-set of a river basin

Water quality: Total nitrogen discharge to Moreton Bay for different water management options

Coupling with multi-objective optimisation/MCA to identify optimal mix of sources in Adelaide

Key paper: Moglia M, Perez P, Burn S (2010) Modelling an Urban Water System on the Edge of Chaos, Environmental Modelling and Software 25(12), pp.1528-2538

Irrigation modelling

Farm scale bio-physical models (e.g. APSIM) consider:

- Physical properties of different crops over growing period
- Soil type
- Water and heat stress
- Irrigation efficiency
- Fertiliser application
- Yield and production

Regional scale crop models (e.g. Source) consider:

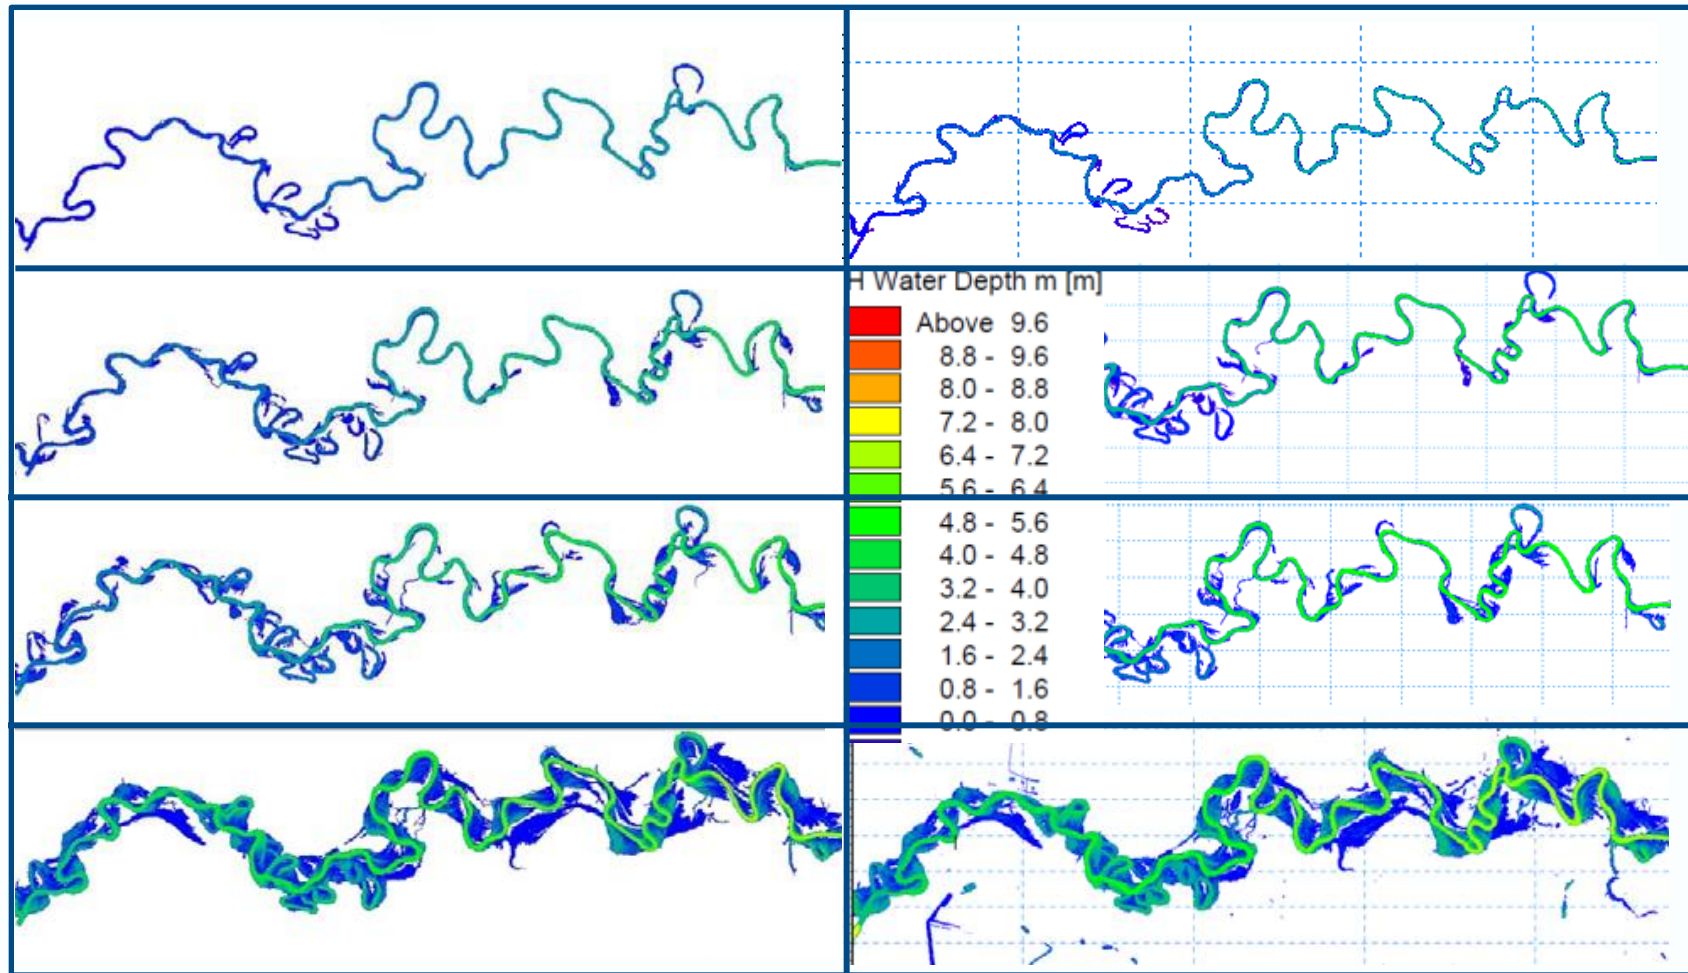

- Supply storages both regional and local
- Water access rules
- Multiple water sources (surface and groundwater)
- Distribution and return systems (irrigation districts)
- FAO 56 crop factors to drive current use and future demands
- Losses (channel, escapes, deep percolation)
- Crude yield and production estimates

Floodplain modelling hydrologic vs 2d hydrodynamic

a) Simulated inundation by LiDAR based approach

b) Simulated inundation by 2D HD model

22 month event
10 minute run time

55 day event
10 day run time

SW-GW interaction

- Establishing relationships in losing and gaining streams
- Validating the relationships
- Integrating with the river system model

Legend

Surface water - Groundwater interaction

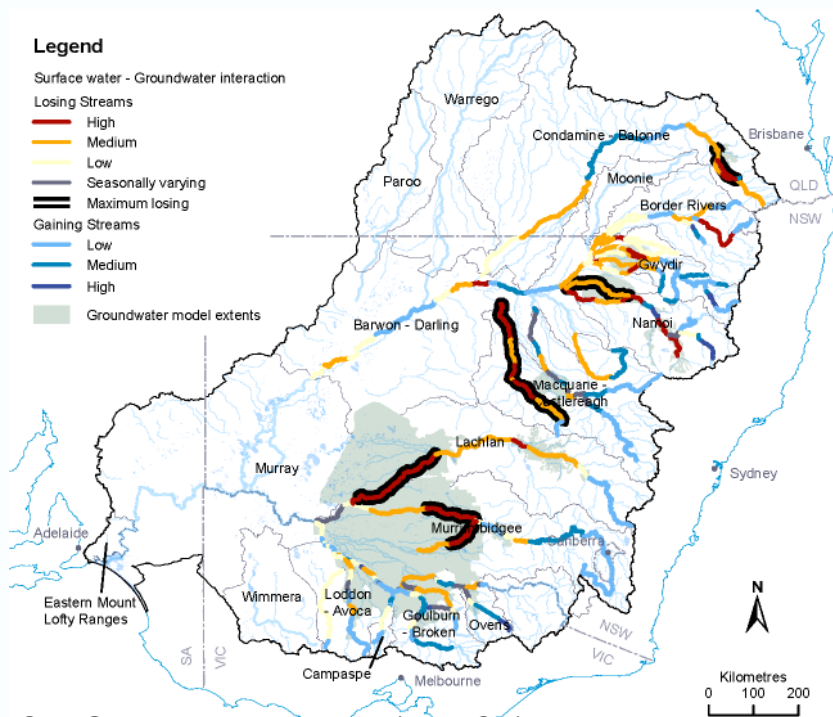

Losing Streams

- High
- Medium
- Low
- Seasonally varying
- Maximum losing

Gaining Streams

- Low
- Medium
- High

Groundwater model extents

SW-GW connectivity map (MDBSY)

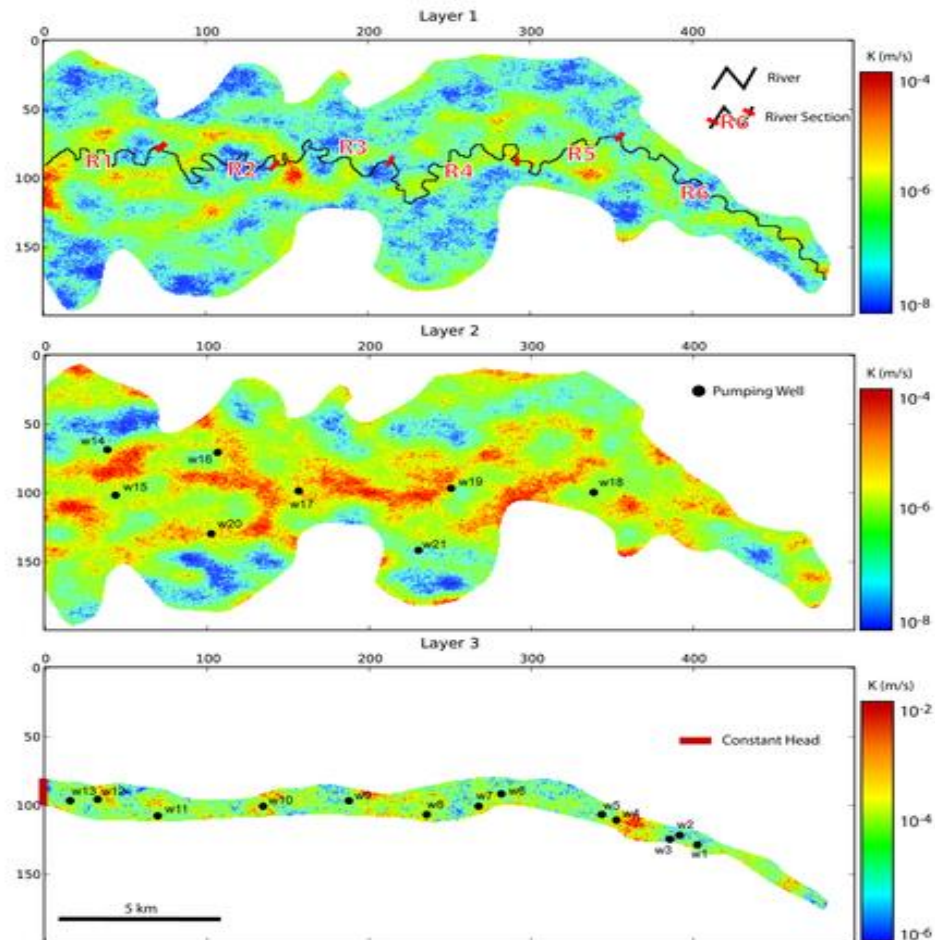

Revised annualised Ungauged Losses and Adjusted Losses (ML): Willara to Wanaaring. (Positive values are losses, negative values are gains)

Revised daily flow components for the year 2000 (ML/d), Willara to Wanaaring. River flow and GW loss are on left-axis, loss/gain functions on the right-axis.

Physically based groundwater models

Ecological Systems: Environmental Flow Modelling

Understanding Ecosystem Complexity

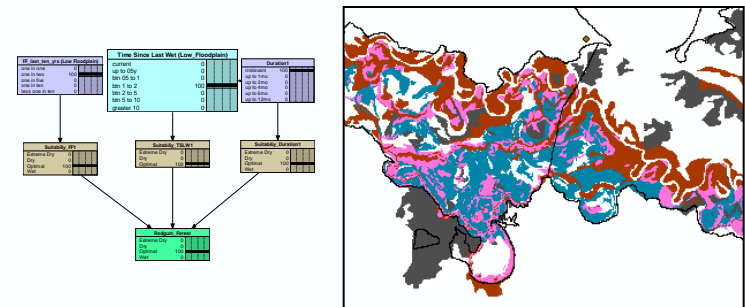

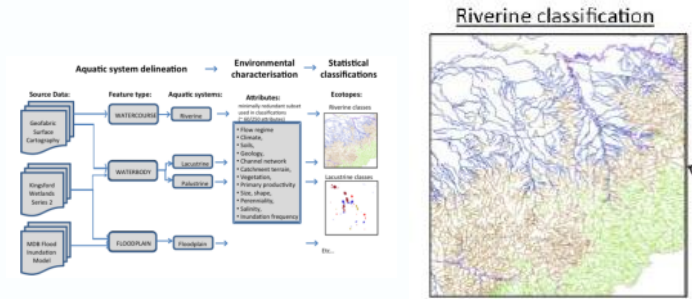

- Species, habitats and refugia

Predicting Ecological Outcomes

- Ecological Response Models
- Driver-Pressure-Stressor-Impact-Response

Integration: Models & Assessment

- Scenario-based tools
- Optimisation-based tools

Environmental Flows: Why? What?

Impacts of....? Vulnerability of ecosystems to....?

- River Regulation?
- Climate Change?
- Hydropower?
- Land cover change?

What to consider in Basin planning?

- *Ecosystem Services*
 - Water Quality
 - Ecosystem function
 - Fish for food
 - Tourism / Recreation
 - Habitat
 - Cultural values
- *Conservation*
 - System assets
 - Biodiversity
 - Threatened species, Ramsar sites

Predicting Ecological Outcomes: Models that are 'Fit for Purpose'

No Data, High uncertainty

Some Data, Some
Knowledge

Lots of Data, Good
Knowledge

Data complete, System
well defined

↑ Participation ↓

Conceptual, Hydrologic
Alteration

Expert system, Habitat
models, Uncertainty analysis

Population dynamics,
Function dynamics

Dynamic ecosystem models

Prioritisation of Effort: A Data Poor Basin

- Defining Ecosystem Classes:

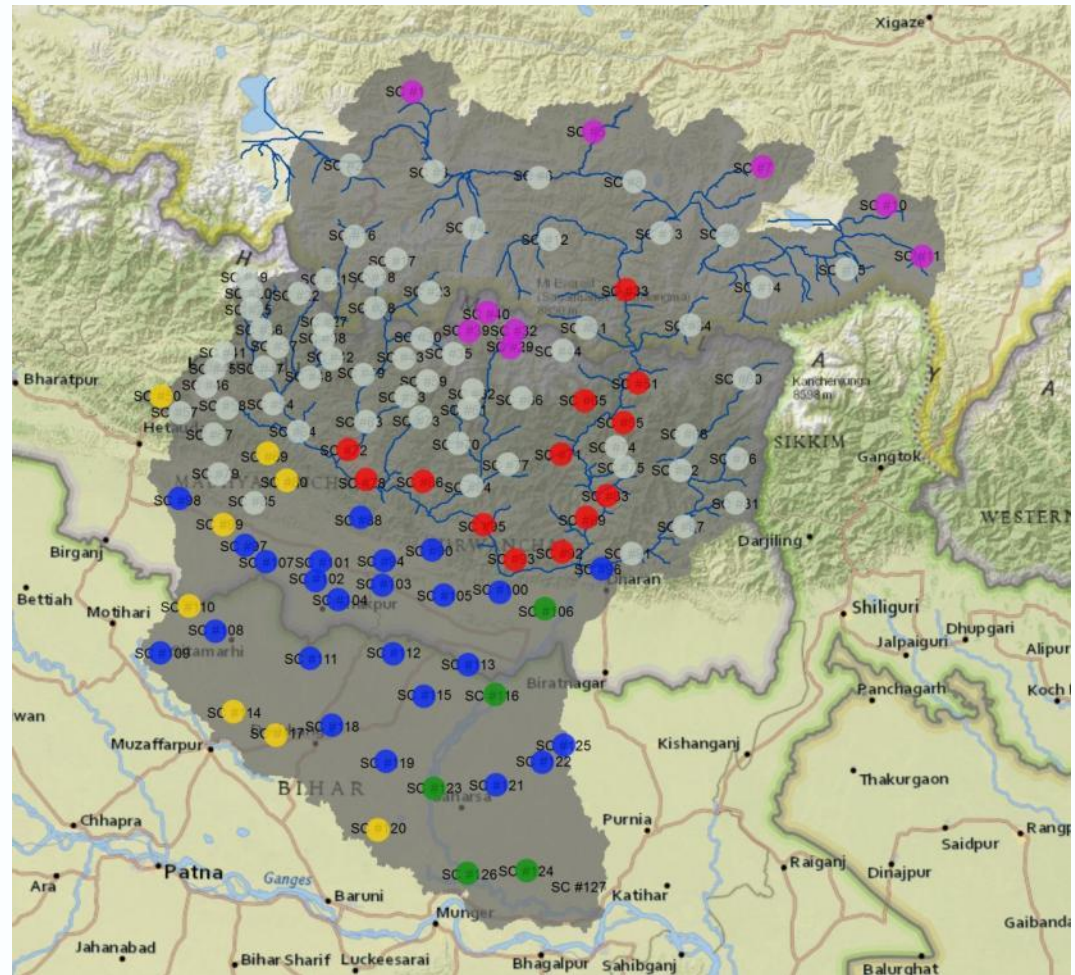

Which **classes** are predicted to **change** hydrologically (dam development, climate change?)

What are the **essential services, functions and assets** by class?

Classes for **extrapolation**

Assessment: Uniqueness, Vulnerability to change

STREAM TYPE	VALLEY SLOPE .020				
	E4	C4	G4	F4	E4
SLOPE	.008	.010	.015	.012	.008
CROSS-SECTION					
PLAN VIEW					
CHANNEL ADJUSTMENT STAGES	1	2	3	4	5

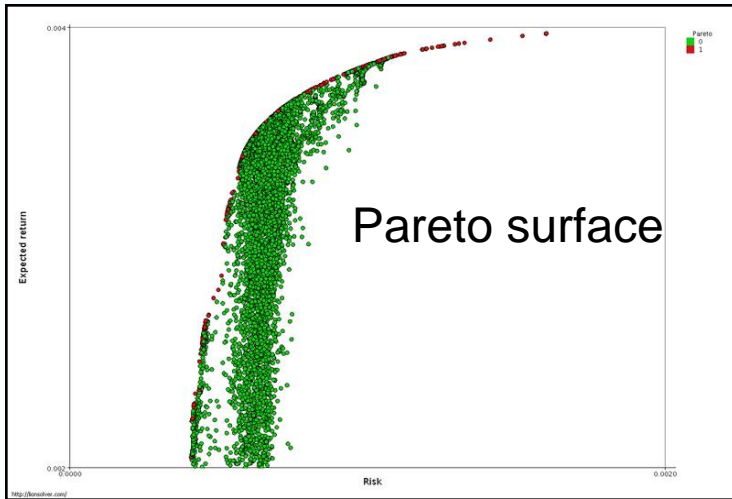

Economic modelling

Local scale (farm, hydro station)

Regional scale (irrigation districts, countercyclical trade)

National scale (computable general equilibrium)

Trans-boundary scale (trade between countries)

Workflows to integrate and run models

Many different workflow tools are available

Allow different models, data sources and outputs to be connected together in a windows based interface.

Can connect different scale models

Can link hydrologic, environmental and economic models.

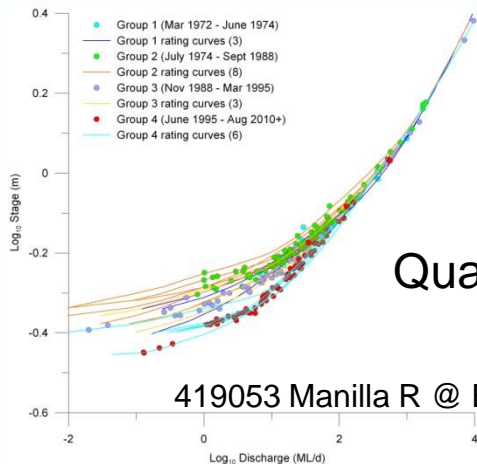

Can use HPC to run things many times on lots of computers.

Provides provenance so that you can reproduce results

Uncertainty and risk assessment

Quantifying rating uncertainty

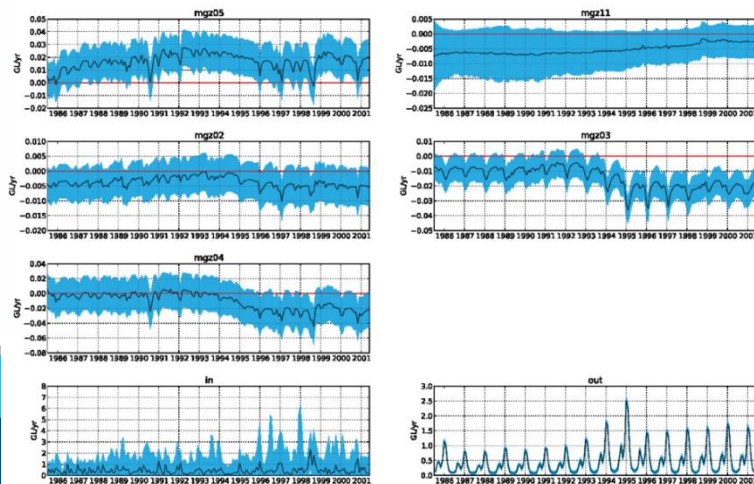

419053 Manilla R @ Black Springs

Quantifying rainfall uncertainty

Quantifying river model uncertainty

Quantifying groundwater model uncertainty

BATEA Uncertainty analysis

Bayesian Analysis: A "learning" paradigm

prior knowledge × *likelihood* → *posterior knowledge*

Bayes' Equation [Rev Tom Bayes, 1763]

$$p(\theta | D) \propto L(D | \theta) p(\theta)$$

In hydrological modeling, Bayes equation can be used to describe the distinct sources of uncertainty

θ = quantity of interest, D = data

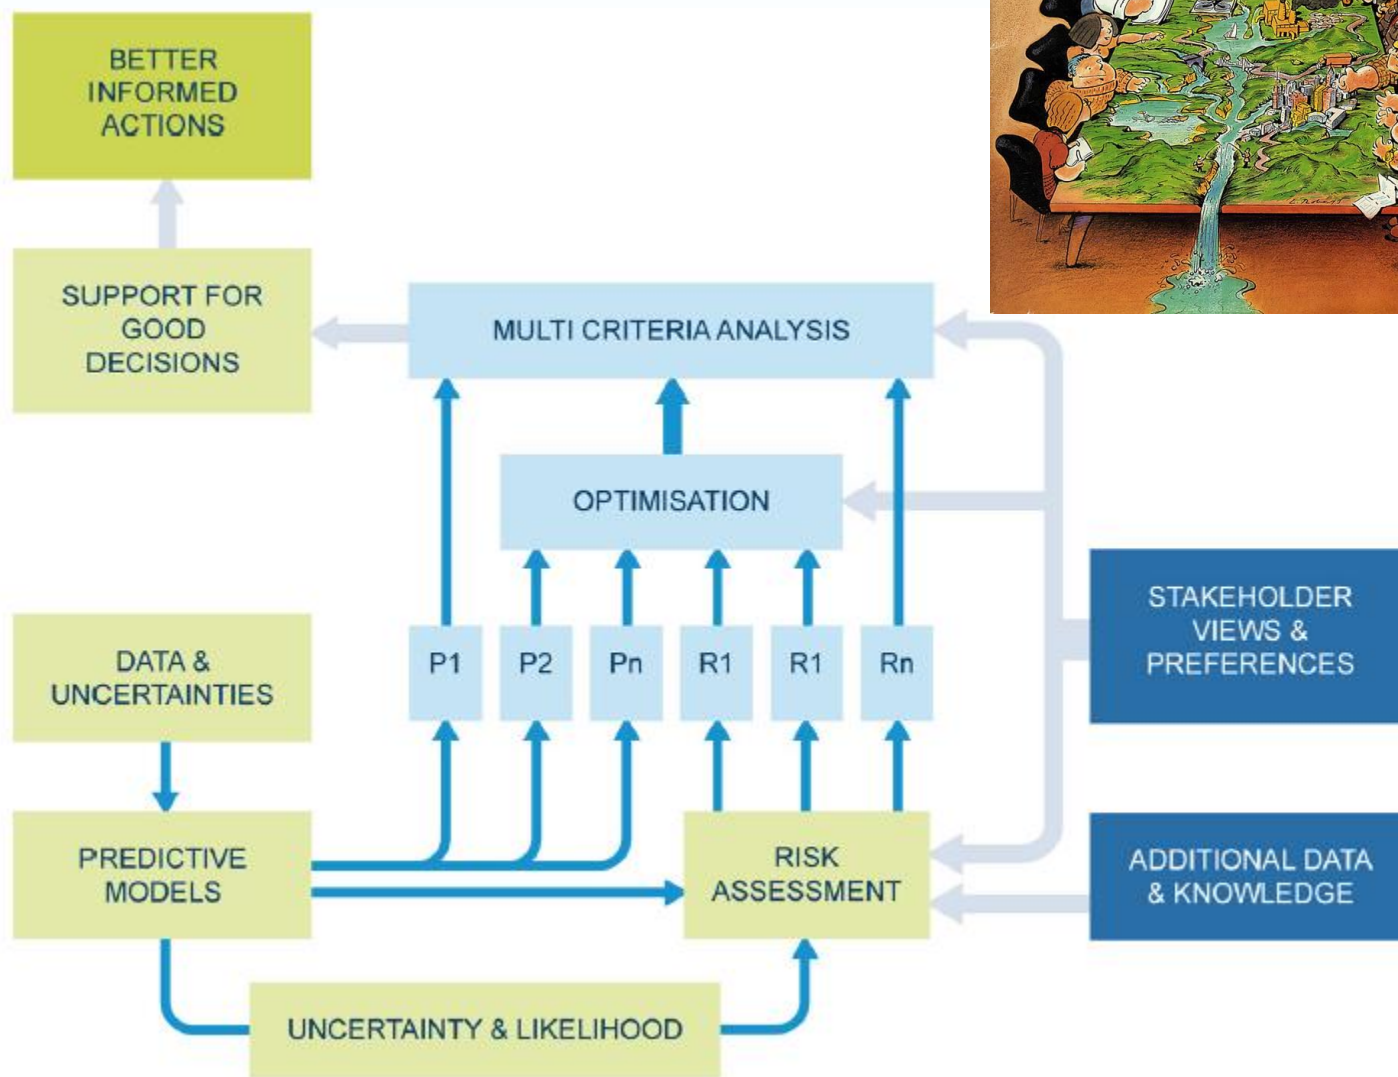

Decision Support

KEY:

P = Performance

R = Risk

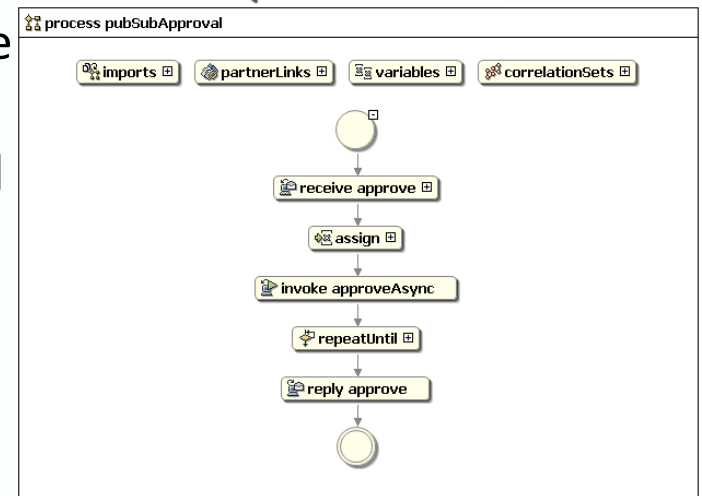

Emerging Technologies

The cloud

- Running models as a service
- Running workflows as a service

Semantic web, linked open data

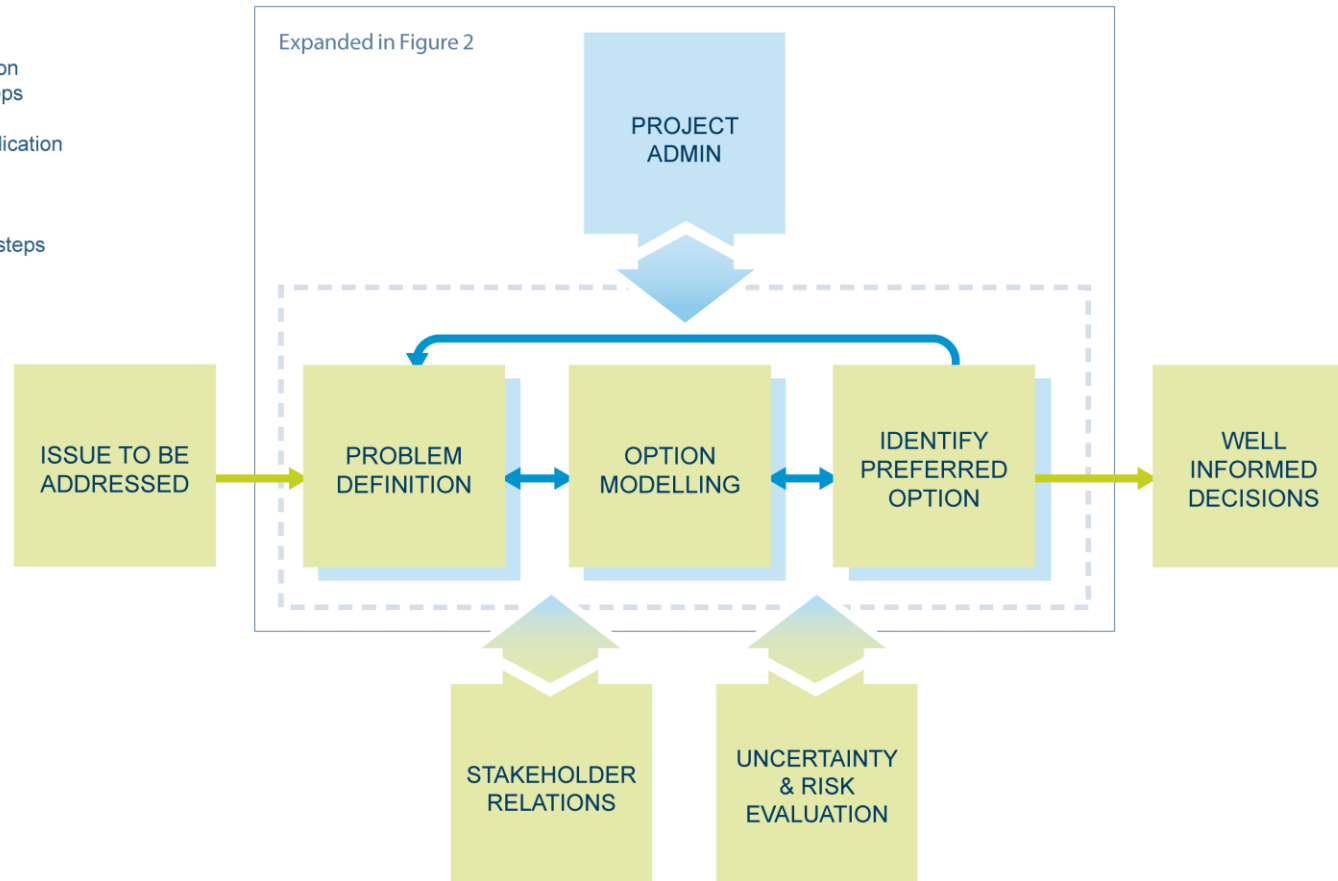

- Common data formats (e.g. WaterML2.0)
- Linking models to data and parameters via the web
- Making results publicly available in a standard form

Best practice modelling framework

KEY:

- Key decision making steps
- Model application procedure
- Technical modelling steps
