ABSTRACT

Since time immemorial, water from rivers is being used for many purposes. Water is the life line of all the living beings on this Earth. In order to assess the quality of surface water in river Cauvery along with its tributaries a purpose driven study (PDS) under HP-II “Study of river water samples at various sites in Southern Karnataka” has been taken up.

Fourteen monitoring stations were selected giving due considerations to all the tributaries of river Cauvery. The selected points are ; Chiklihole river near reservoir, Cauvery near Kushalanagara, Cauvery near K.R.Nagara, Harangi near Kudige, Yagachi near Alur, Lakshmanatheertha near Bilikere, Lakshmanatheertha near Hanagodu, Kabini near H.D.Kote, Kabini near Suttur, Nugu near Chikkanandi, Taraka near Madapura, Shimsha near Halagur, Suvarnavathy near Kollegala and Lokapavani near Sreenivasa Agrahara.

The study was proposed for a duration of two years. The study was commenced in the month of December 2009 and final sample collection was done in the month of December 2011. The water samples were analyzed for 27 parameters as mentioned in HP-I mandate.

The parameters considered in the study are Colour, Odour, Temperature, pH, Electrical Conductivity (EC), Dissolved Oxygen (DO), Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total Hardness, Chloride, Nitrogen Nitrite and Nitrate, Ammonical Nitrogen, Sulphate, Calcium, Magnesium, Boron, Iron, Fluoride, Sodium, Potassium, Carbonate, Bicarbonate, Total Alkalinity, Total Dissolved Solids (TDS), Total Coliform and Faecal Coliform.

From the study, it is seen that pH level at all points is in the range of 6.5 to 8.5. The DO in all the monitoring rivers is above 6 mg/l except in Suvarnavathy. The average BOD at all the points is less than 3 mg/l. Higher Coliform count is found in all the river which is because of human activities. Higher Alkalinity is observed in Taraka, Lakshmanatheertha near Bilikere, Shimsha and Suvarnavathy.

All other chemical parameters at all the stations are well within the desirable limit as prescribed by the IS code. Water Quality Index calculated using CCME method reveals that the WQI of Chiklihole is around 80 for Class A, as per use based classification. The quality of water at all other monitoring stations very well satisfy for Class C classification and are also suitable for irrigation purpose.

CHAPTER -1

INTRODUCTION

1.1 GENERAL:

Cauvery is a major river in Karnataka having second largest basin area. Area wise Krishna basin is the largest with a basin area of 1,13,290 sq.km which accounts to about 59.48 % of geographical area. Cauvery basin with an area of 34,270 sq.km accounts to about 17.99 % of geographical area.. Cauvery river originates at Talacauvery on the Brahmagiri Range of Hill in the Western Ghats in Kodagu district of the Karnataka State at an elevation of 1,341m (4,400 ft.) above mean sea level. The length of river Cauvery in Karnataka is 350 km. The river Cauvery has seven major tributaries such as Harangi, Hemavathy, Lakshmanatheertha, Kabini, Suvarnavathy, Shimsha and Arkavathy. The other minor tributaries include Nugu, Taraka, Chiklihole, Yagachi and Lokapavani.

1.2 SALIENT FEATURES OF MONITORING RIVERS:

The length of chiklihole river is 24 kms with a catchment area of 57 sq.km. Its catchment area comprises forest and coffee plantation with scarce human settlements. The only activity observed is coffee de –pulping process.

Cauvery river from its origin upto monitoring point at Kushalanagar has a length of 98 kms with an influencing catchment area of 1259 sq.km. Harangi has a length of 43 km up to its monitoring point at Kudige with influencing catchment area of 580sq.kms. The catchment area consists of forest, agriculture and plantation land. Many major towns are located in its catchment with many number of coffee processing units.

Cauvery river from Kushalanagar to monitoring point at K.R.Nagar has a length of 77 kms with an influencing catchment area of 3253 sq.km. The main activity is agriculture with irrigation facilities. Many major towns are located in its catchment. No major industries are located except one sugar manufacturing unit located at Chunchanakatte on the river bank.

Yagachi river has a length of 53 km from its origin upto monitoring point at Alur with an influencing catchment area of 854 sq.km. Its catchment area consists of agriculture and plantation land.

Lakshmanatheertha has a length of 68 km from its origin upto its monitoring point at Hanagodu with a catchment area of 915sq.km. Its catchment comprises mostly of forest land. The length of river from Hanagodu upto its monitoring point at Bilikere is 62 km with an influencing catchment area of 1658 sq.km. The main activity is agriculture with irrigation facilities.

Nugu river has a length of 99 kms from its origin to the monitoring point with a catchment area of 1271 sq.km. Its catchment area consists of forest and agricultural land. Taraka river has a length of 54 kms from its origin upto the monitoring point with a catchment area of 549 sq.km. Its catchment area consists of forest and agricultural land.

Kabini river from its origin upto monitoring point near H.D.Kote (Saragur) has a length of 110 kms with an influencing catchment area of 2336 sq.km. Its catchment area consists of forest and agricultural land. The second monitoring point for Kabini at Suttur is 212 km from origin with an influencing catchment area of 6809 sq.km. The main activity is agriculture. A major pilgrimage centre and major industrial area is located on the upstream of the river monitoring point.

Lokapavani has a length of 57 km with a catchment area of 470sq.km. Its catchment consists mainly of agricultural lands with and without irrigation facilities. The river flow is considerable even during non monsoon season which is due to return flow from irrigated lands.

Shimsha has a length of 202 kms from its origin upto monitoring point near Halagur. The catchment area is 7740 sq.km. The catchment area consists of agricultural lands with and without irrigation facilities. A number of medium and small scale industries are located in the catchment.

Suvarnavathy has a length of 73 kms from its origin upto monitoring point near Kollegala with a catchment area of 1521 sq.km. The catchment area consists of forest and agricultural lands.

1.3 ABOUT THE STUDY TAKEN UP:

A Purpose Driven Study under HP-II “Study of river water samples at various sites in Southern Karnataka” has been taken up by Karnataka Engineering Research Station, Krishnarajasagara. The study was estimated for Rs. 17.20 Lakhs and commenced during the month of December 2009.

Rivers in Cauvery basin were considered for assessing quality characteristics of surface water in the purpose driven study. The river monitoring points are given vide Annexure-I and map vide Annexure-II.

The study was intended for a period of two years from the month of commencement and accordingly the last samples were collected in the month of December 2011.

1.4 OBJECTIVES:

- To assess the general trend in quality of water.
- To assess the suitability of water for various uses.
- To classify the monitoring stations for future monitoring.

CHAPTER -2

LITERATURE REVIEW

Water is the basic necessity for life. Water is very precious compound whose quantity and quality is to be preserved. The quality of surface and sub surface water sources is getting polluted these days due to over exploitation in the name of development. Hence, in order to ensure good health of the public, it is very essential to protect the quality of water used especially for drinking.

Agriculture is the major activity in our country providing lot of employment. Self sustenance of any country depends on its capacity to provide food security to its masses. Moreover, it is not always possible to depend entirely on rainfall and therefore irrigation plays a major role. The water supplied for irrigation purpose should meet certain quality criteria as given in IS 11624-1986.

The most important quality parameters for drinking water are pH, Hardness, Alkalinity, Chloride, Total Dissolved Solids, Fluoride, Sulphate, Boron and Nitrate. The parameters to be considered for irrigation purpose are Electrical Conductivity, Boron, Residual Sodium Carbonate (RSC) and Sodium Adsorption Ratio (SAR).

The quality of water can be ascertained by analyzing and testing the physical, chemical and microbiological or bacteriological characteristics.

Physical analysis of water is carried out in order to determine the physical characteristics of water. This includes colour, taste, odour, temperature, turbidity.

Physical characteristics:

Colour is imparted due to presence of organic matter and some inorganic materials such as coloured soil. The excess growth of algae and aquatic micro-organisms may also impart colour to water. The presence of organic matter, inorganic salts and dissolved gases impart taste and odour to water. Turbidity is caused due to the presence of large amount of insoluble suspended matter such as clay, silt and finely divided organic matter. The turbidity depends upon the fineness and concentration of particles present in water.

Chemical characteristics:

Chemical Analysis of water is carried out in order to determine the chemical characteristics of water. This includes pH, Electrical Conductivity, BOD, COD, hardness, chloride, nitrogen, total solids, iron, fluoride, other minerals and dissolved gases.

pH:

pH is a measure of the hydrogen ion concentration in water. pH is reported as an inverse log with a scale ranging from 0 (acidic) to 14 (basic). Therefore, a small change in the pH reflects a tenfold magnitude of change in the ambient environment.

Electrical Conductivity:

Conductivity is a measure of the dissolved ions in water and is reported in micro-mhos/cm as specific conductivity at 25°C. Conductivity can be related to the amount of dissolved solids in water. With increase in temperature the conductivity also increases.

Hardness:

Hardness in water prevents the formation of sufficient lather when mixed with soap. This is caused due to the presence of calcium and magnesium salts in water. The hardness due to bicarbonates and carbonates of calcium and magnesium represents the temporary hardness which is also called as carbonate hardness. The hardness due to nitrates, sulphates and chlorides of calcium and magnesium is known as permanent hardness or non-carbonate hardness.

Alkalinity:

The alkalinity of water is due to the presence of bicarbonate, carbonate and hydroxides. The presence of alkalinity aids in coagulation.

Chlorides:

Chlorides are generally present in water in the form of sodium chloride. This may be due to leaching of marine sedimentary deposits, pollution from domestic wastes and sea water intrusion.

Nitrogen:

The presence of nitrogen is an indication of the presence of organic matter. They may occur as free ammonia - very first stage of decomposition of organic matter; albuminoid nitrogen - nitrogen present in water before decomposition has started; nitrite - partly decomposed organic matter; and nitrates - fully oxidized organic matter in water.

Total Solids:

This represents the total amount of solids, both suspended as well as dissolved present in water.

Dissolved Oxygen:

Dissolved oxygen (DO) is a measure of the concentration of O₂ molecules in water. DO is measured in mg/L. The DO in water decreases during decomposition of organic matter. Minimum DO required for the survival of aquatic life is 4 mg/l.

Biochemical Oxygen Demand (BOD):

The BOD is the measure of oxygen required to oxidize the organic matter by micro-organisms.

Chemical Oxygen Demand (COD):

COD test measures both biologically degradable and biologically non-degradable organic matter. COD is used to measure the oxygen equivalent of organic matter content of a sample that is susceptible to oxidation by strong chemical oxidants.

Fluoride:

Fluoride is both beneficial and toxic depending upon its concentration. At very low concentrations it causes dental carries in children and at high concentration it leads to skeletal fluorosis - a crippling bone disease.

Water Quality requirement for irrigation use:

The Residual Sodium Carbonate (RSC) shall be determined by the equation;

$$RSC = (CO_3^{--} + HCO_3^-) - (Ca^{++} + Mg^{++})$$

Where CO_3^{--} = Carbonate ion concentration in me/l

HCO_3^- = Bicarbonate ion concentration in me/l

Ca^{++} = Calcium ion concentration in me/l

Mg^{++} = Magnesium ion concentration in me/l

The Sodium Adsorption Ratio (SAR) shall be determined by the equation

$$SAR = Na^+ / \sqrt{(Ca^{++} + Mg^{++}) / 2}$$

Where Na^+ = Bicarbonate ion concentration in me/l

Ca^{++} = Calcium ion concentration in me/l

Mg^{++} = Magnesium ion concentration in me/l

Other parameters to be observed are Electrical conductivity and Boron.

CHAPTER -3

METHODOLOGY

11 rivers (River Cauvery and some of its major and minor tributaries) at 14 different location sites were selected for the study to assess the variation in water quality due to various activities in the catchments. The monitoring location sites were so selected that the various activities leading to possible pollution may be identified. For the convenience of sampling, all the sample collection points were selected at the bridge locations.

The samples were collected once in every month and tested for 27 parameters. List of parameters analyzed is given vide Annexure -III. The samples so collected were analyzed for field parameters, general parameters and coliform group.

The field parameters such as colour, odour, temperature, pH, Electrical Conductivity and DO were tested immediately after the collection of sample.

For general parameters, the samples were collected and immediately transported to the laboratory in a polythene-can of 5 litres capacity placing it in an ice box i.e., maintaining a temperature of 4^o C.

The samples for dissolved oxygen were collected using DO sampler in a BOD bottle of 300 ml capacity. The sample meant for final DO test was placed in the ice box and transported to the laboratory for further incubation for a period of either 3 days at 27^o C or 5 days at 20^o C.

The samples for Coliform group were collected in the pre-sterilized bottles and transported to lab in sterile condition placed in ice box. Initially the coliform tests were done without dilution and hence the maximum value reported is 1600 MPN /100 ml. Later dilution of samples was carried out and the values are reported accordingly.

The sample analysis method for all the parameters is given vide Annexure -IV.

CHAPTER -4

TEST RESULTS AND DISCUSSION

TEST RESULTS:

The monthly test results of all fourteen monitoring station over two year period is averaged to obtain the overall quality of water. The test results obtained are compared for variation with respect to tolerance limit for both drinking and irrigation purpose as per relevant IS. Tolerance limit for drinking and irrigation are given vide Annexure V and VI respectively.

The result data were verified for outliers using statistical method. The high and low outliers were not considered in averaging the monthly data.

In order to assess the suitability of water for various uses, water quality index is calculated using Canadian Council of Ministers of Environment (CCME) water quality index -1.0. Separate water quality index is calculated for **Class A with Total Coliform**, **Class A without Total Coliform** and **Class B** as per use based classification of surface water. Use based classification of water is given vide Annexure – VII. The water quality index for irrigation purpose is calculated taking into consideration the parameters mentioned in IS 11624 -1986.

To represents the average concentration of each parameter at all the monitoring stations, graphs are plotted with average concentration in the ordinate and monitoring stations in the abscissa. The graphs are given vide Annexure – VIII and the test results vide Annexure –IX.

DISCUSSION:

Generally it is observed that DO at all the stations is above 6 mg/l except in Suvarnavathy. Higher DO is found in Shimsha because of turbulent and low depth of flow. In Chiklihole, the DO is higher because of photosynthetic activity of algae.

Total Alkalinity concentration is above 200 mg/l in Taraka, Lakshmanatheertha near Bilikere, Shimsha and Suvarnavathy. This is due to soaps and detergents entering the water body because of laundry activity. Coliform of both types are found higher in Taraka, Suvarnavathy and Lokapavani because of human activities and lean flow during most of the months.

CHAPTER -5

CONCLUSION

- pH at all the fourteen monitoring stations are in the range of 6.5 to 8.5 as per IS stipulation.
- Dissolved Oxygen at all the stations is above 6 mg/l except in Suvarnavathy near Kollegala.
- Total Dissolved Solids at all the points is well within permissible limit of 500 mg/l.
- The average BOD level at all the stations is less than 3 mg/l.
- The water is relatively soft in Chiklihole, Cauvery near Kushalanagar, Harangi, Yagachi, Lakshmanatheertha near Hangodu and Kabini (i.e., total hardness less than 100 mg/l)
- Alkalinity above 200 mg/l is observed Taraka, Lakshmanatheertha near Bilikere, Shimsha and Suvarnavathy.
- Higher coliform are found in all the river monitoring points and this is attributed to human activities.
- All other parameters are well within permissible limit as stipulated by the IS.
- Chiklihole can be grouped under Class A, as per use based classification since its water quality index is 78.
- All other river water has a water quality index in the range of 50 to 60 for Class A and above 80 for Class C.
- The water at all the points is most suitable for irrigation purpose.

The water at all the stations confirm to Class C specifications as per use based classification. The overall quality of water at all the monitoring points is not much affected by present activities in catchment area and hence does not need regular monitoring. However in order to ascertain any change in quality due to future variation in land use pattern, it is desirable to monitor these rivers twice a year (i.e., pre monsoon and post monsoon).
